Introduction to Critiques of Knowing

Lynette Hunter

Editors' Introduction

What follows is a slightly modified version of the Introduction to Lynette Hunter’s C Knowing: Situated Textualities in Science, Computing and the Arts (Rout. It has been included here at our request, for we believe it to be an innovative and impor. unique, instance of cultural analysis. As is immediately obvious, the section printed be argument which points to the limitations of many branches of current theory, often exp same time as demonstrating the strengths of this reconsidered manner of engaging with study, a proposal which is carried out in the subsequent pages of Critiques of Knc we hope, the reasons why we wanted to include the section in this issue of parallax apparent, too. For, in a strong sense, we see here a ‘metadiscursive’ overview of som issues which informed our conceptualisation of polemics: against cultural stn indicated in the editorial of this issue). What follows we consider to be appropriate as both a polemical piece of writing in itself on the theme of the generation and politics and an introduction to a work which approaches pressing cultural and political concer: a serious re-assessment of what classical rhetoric can teach us about the most con developments in knowledge production.

Rhetoric and Situated Textuality

Textuality, like knowledge, is bound into power, for textuality is both knowing and the way we articulate knowledge. What follows will attempt study of textuality, particularly in the sciences and artificial intelligence in science which has cast itself in the role of a discipline which self-consciously the way that science represents knowledge.

Knowledge and textuality are usually taken to be neutral areas by analys within an institutional structure that obscures the connections with rule. This is what I call the ideology-subject axis which I explore in detail in cl since an understanding of its rhetoric lies at the centre of my understanc recent development in standpoint theory of a concept of critical realis systems of inquiry that foreground particular connections with ruling pow many discourse studies, knowledge and textuality are often taken as dete constructed or constituted by an ideological system. These studies implie
insensitivity and bluntness have come to denote those people outside or the system as ‘abject’. However, within the theory of situated knowledge and in standpoint theory, knowledge and textuality are taken as engaged in by groups of people working on negotiating questions of value and action among relations of non-ruling power and between the non-ruling and the ruling.

In the process of studying the place of textuality within science, I am also concerned to look at what I call the ‘gesture to the arts’ made by both mainstream and standpoint critiques, and to explore the place of textuality in a number of disciplines. The chapter of the book extends the standpoint critique in feminist science and technosciences into aesthetics. The insistent gesture to arts strategies of beauty or plurality as a possible resolution for science, does not take into account the fact that a recognised ‘art’ is just as systematic as science, that ‘beauty’, like the ‘success’ of science, is also an artefact. But aesthetics is also a field tied to the Greek root of word, to ‘feelings’, which are generated by all disciplines, and I would agree with Alison Jaggar that emotions or feelings are often unauthorised modes of knowing the ‘rational’, for example, being an authorised emotion. Aesthetics and epistemology are closely intertwined, for without articulation knowledge remains tacit, and main focus of the extension of standpoint theory into aesthetics is to argue for understanding of ‘situated’ textuality, analogous to situated knowledge. Situational textualities occur where people work on words together to build common ground for the articulation and valuing of knowledge, and in order to argue for them, work draws not only from contemporary work in the social history of science also from the history of rhetoric.

Standpoint theory argues that knowledge that is articulated from the standpoint of those excluded from ruling relations of power, is a particularly important kind of knowledge. Because of the exclusion, the knowledge that is offered from that exclusionary position is quite different to that current within the ethical and ideological system of a society and its culture, and is therefore a source of assessment and potential change and renewal. The theory is concerned with articulating situated knowledge with retaining a concept of the real in the sense of critical rather than naive real and with re-defining the ‘individual’ to account for people who are not subjects to account for the not-subjected of people’s lives.

In science, where standpoint has been explored at length, there is, in recent decades and as the later chapters discuss, a critique of scientific objectivity based on self-limitation resulting from the exclusion of, among other things, women knowledge. In politics, there have been critiques of the curious doubleness of autonomous yet universalist man constructed by the liberal democratic system, because the necessary isolation of that individual obscures the situated of their lives. In philosophy, we find the critique of value-free assumptions in empiricism and idealism, because the notion of ‘value-free’ denies history. And in the social sciences, there is the debate between quantitative and qualitative methodology, the latter arguing that verisimilitude, repeatability and enumerativeness evade the contextual pressures of living.
authority, often, if not usually, without words. The critiques delineate tacit of various kinds, and all recognise the need to work on words to bring knowledges into communication. In nearly every case the pathway out tow which the critiques offer, is through story, narrative, or poetics, yet there is critique of the aesthetic constraints on these materials. The result is a ph hiatus that gestures toward the arts but with no concept of the situatec needed to articulate situated knowledge, its contexts and its value.

Rhetoric is a field that insists on the bringing together of textualities, s politics. It has traditionally been concerned with social context, and distinguished between the situated, the systematic and the authoritarian concerned with different approaches to truth: truth as certain, as plausil negotiated or probable. And rhetoric is also concerned with the ways indiv groups wield power, the ways they delimit and extend the possibilities interaction. Throughout the book I turn to writings on rhetoric from tl period, and particularly to the texts on rhetoric by Plato and Aristotle. M elaboration of the political structure of democracy is bound up in those ri is the development of epistemology and attitudes to value. The infusion of t throughout many discourses has led to virtual images of Plato and Aristo formed in each historical place and time, answering to its needs. All of t discussions return to these classical texts, partly to help dismantle unhelp in earlier metadiscourses, and partly to rebuild alternative versions more a to today. Much of my reading of Plato and Aristotle affirms and lends weight to situated knowledges and standpoint theory. In bringing a refreshes to a contemporary need articulated in feminist theory, the rhetorical ar moves the theory from epistemology into aesthetics both in my critic aesthetics of different disciplines and in my exploration of different kinds of textuality as inadequate and hence merely a code, textuality as (in)ade hence transgressed and transcended, and textuality as necessarily limit materiality of language and therefore the ground for common work on v

Standpoint theory comes close to discourse studies in many of its concer for critical realism separates the two. Discourse studies are profound up in the constitution of social systems, and find it difficult to deal with of the ‘real’, for reality is messy and requires that systems relax and get in the nets of living. Yet each does vital work: Standpoint in its focus on relations, and discourse studies in their focus on the constraints of ruling constitute individuals. To distinguish between ruling and non-ruling rela distinguish between areas that need different kinds of rhetoric, tha themselves not only in different kinds of knowledge but also in differer textuality. And explicit through the book is the political context of democratic social contract that underwrites the dominant modes of know textuality with which I live, and which it mediates through the rhetoric of th that represents many western nation states to their subjects.

The first chapter of this book analyses the ideology-subject axis and its r order to assess the connections of knowledge and textuality with ruling
are common to plausible rhetoric as defined throughout the history of recontextualizations. They include: the assumption of common grounds rather than a discussion and agreement to them; the veiling, hiding, and obscuring of constructed status of these common grounds; the isolation of the system to preclude ground from question and change; and the procedure of arguing always within the system, always from the accepted common grounds. When one knows that this of strategies is happening, the rhetoric can be recognized as an expedient rhetoric that is often successful.

At the centre of the rhetorical stance of ideology is the assumption that represents can be adequate to a lived reality rather than a set of negotiations around limitations of language. It implies that communication, here political communication between the individual and ruling power, cannot be negotiated differently, shifted to greater adequacy. The practice of this assumption develops into the construction of the isolated, autonomous subject, increasingly constituted by ideology as the subject acquires the stability necessary to its legitimation. Further, as it develops st representations, it leads to a focus on visual accuracy and repeatability underwrites the concept of objective knowledge. The ideology of the nation state is common to both politics and science.

A constant thread through all the chapters, is the recognition that much of political theory takes science as the ‘best-case’ for politics. And, as I examine in the last two chapters of the book, feminist standpoint theorists in the social studies of science offer direct critiques of the political systems that support it. Science appealing to analysts of the representative democratic state, since it works within a stable set of parameters that enclose its grounds, isolate its community and all to be subject to a rational logic that achieves its success by gaining legitimation from the structures of the system that generates it. Hence issues of legitimation, and science or political systems justify themselves to their constituents, become central. Modern science has achieved this stable state through increasing involvement in industry and in commerce that need stable technology to maximize profit. Industry and commerce also need stable politics, and since the seventeenth century capitalism nation states have achieved this stability through ideology. Chapter One outlines the rhetorical stance of ideology, which stabilizes the representation of those in power as well as the identity of individual citizens who become subject to that power, argue that the stance purposively excludes some social relations and communities in order to remain stable, and constructs an axis of representation relating ideology to the subject.

Aristotle describes exactly this phenomenon of communication in his discussion of rhetoric appropriate to ‘science’, by which he means the conceptual knowledge developed within a small group of people, rather than an experimental method could be used by many. He spells out the strategies and devices that are used to construct stability and repeatability, but he also says that such rhetoric is appropriate to social interaction because it is enclosed, and hence obstructed negotiation and the discussion of differences necessary to political action. He recognizes that there is a rhetoric aimed at success is not appropriate for politics because it

Central to the argument of this book is that both ideology as represent-
state, and the language that represents scientific practices, use similar 
strategies and devices but for different reasons. The experimentation at t 
modern science, which has come to define the ‘natural sciences’, is ir 
primary medium of scientific textuality and should locate its aesthet 
conveying the activity of that textuality, science uses language to conn 
other people. However, modern science developed during an historical p 
thories of language were attempting, unsuccessfully, to achieve full adeq 
real, and since language is always different in reality, it appears to be i 
The response of science to this dilemma, which is discussed at length ar 
by scientists during the seventeenth and eighteenth centuries, is to use l 
a code, and to employ mathematical language, which of course appears 
effect because it operates wherever possible within a pre-defined terr 
scientists can understand that there is a real world with which the experime 
but for the large part of the population which is unfamiliar with exper 
second order code of language is the reality of science.

In chapter two, I argue that today, this understanding of science is exac

does. At the same time, using the example of humanities computing, thes 
study the pervasiveness of the belief that these techniques are indeed wil 
has to offer. The commentary suggests that the persuasion is particular 
when adopted by the arts and humanities where textuality is not used 
order code but as primary material, albeit within an aesthetic system.
has to be said that many people working in the arts and humanities have reje 
computing precisely because it mimics the set of epistemological conditions that 
challenge. But with hypertext, which seems to offer different strategies, some of 
resistance has begun to break down.

The third chapter turns to a study of what mainstream philosophy of science 
about the representations used by science. These commentaries frequently refe 
or focus on computing and AI because of their claims to display the representat 
of science. The argument here suggests that philosophers of science, with a 
exceptions, underwrite a notion of textuality that explicitly draws on the (in)adeq 
of language and results in representation either as second order code or 
transcendence/transgression. Mainstream philosophy of science also freque 
gestures to beauty or plurality as a possible resolution for science, and does 
understand that much recognised ‘art’ is just as systematic as science. However, 
misunderstanding is not surprising since many critics and intellectuals who comm 
on art do not themselves recognise the systematic structure of ‘beauty’ nor 
il ideological construction of plurality. Indeed, the one is frequently offered a 
resolution to the other, in an essentialist/relativist stand-off that is redoublec 
political and aesthetic debates about authenticity as identity politics as age 
multiculturalism.

Chapter four works from a rhetorical critique of dominant theories of language 
textuality as (in)adequate, to suggest that there are different kinds of first or 
textuality or textuality as primary material, and that the different textualities p 
different kinds of legitimating practices for knowing, different ways for people 
represent value and to value representation. The critique returns to computing 
to a case study from hypertext methodology to emphasise that no techniqu 
enclosing, isolating or reductive, or exploratory, contextualising and flexible, in it 
or is either authenticity or self-reflexiveness in itself enabling. Communicative t 
from all disciplines need a rhetorical analysis of stance, which will position 
techniques and strategies historically, politically and socially. Such an analysis situ 
the textuality and in so doing situates the knowledge.

The concept of language as (in)adequate to the real is also central to theorie 
aesthetics and criticism in the post-Renaissance period. Chapters five and six m 
through a standpoint critique of science to a critique of aesthetics. Within the moc 
nation state, the artist is cast as the allowed or permitted transgressor of ideolog 
enclosure, and intellectuals or critics are those who articulate to the state the k 
of transgression being enacted. Art itself is perceived to be activity that attempt 
transcend the inadequacy of ideological limitation. In doing so it produces bee 
as it wrests some element of social reality from ideological obscuing into cults 
articulation. At the moment of articulation such work produces intense joy, 
partly because it sits so neatly into the interstices of ideology it is often called ‘tru 
Yet none of these designations account for the personal and individual work on wc 
and other media carried out by artists. As I argue in chapter five, these designati

by licensed citizens of the nation state.
critical vocabularies for aesthetics, encourage or admit contact with the s
of non-ruling relations. This a standpoint analysis can make clear. But i
case, then what does the gesture of resolution toward the arts made by p
of science, whether they be mainstream, standpoint, feminist, or
contribute? What makes it simpler for discipline-specific language to deny
relations is that ideology and the public understanding of the sciences,
and the arts, assume that the function of language is to be adequate to
world. I suggest throughout this book that in effect art, science and con
work rather differently in their immediate activity with the material world
they engage, acknowledging the limits of language and negotiating with it
Without an understanding of rhetorical stance and the situatedness of
standpoint can and has been dismissed as identity politics. Yet with a
situatedness that rhetoric can offer both to knowledge and to text (and to
